Hyperparameters

Learning parameters used during training just to ensure model learns in a good way.

① Max_depth
Height of tree
↑ → overfitting
↓ → underfitting

② Criterion
→ Used to measure purity of split
→ Entropy — Slower
→ Gini — faster

③ Splitter
Decides what kind of split it uses
Best → Select the best split
Random → Select the random split

④ Max_features / columns
How many features selected for split
→ int → 10, 5, 4
→ sqrt →
→ log2

(5) min_samples_split
Minimum samples used for splitting

(6) min_samples_leaf
Minimum sample used at leaf node
